AutoCAD is ideal for architects, engineers, draftsman, and other designers. AutoCAD's users create 2D drawings and make 3D models. The software also has a full feature set of 2D and 3D modeling tools, including a wide range of drafting, technical, and graphical functions. AutoCAD is divided into four main application areas: Drafting Features and functionality found in the drafting application include line styles, text, block styles, dimensioning, block linetypes, polylines, and polylines. Drafting Planned features and functionality for AutoCAD 2012 include support for simple parametric and regular surfaces, linear and spline solids, and perspective (3D) solids. The first tab on the ribbon is the Home tab. The following tabs are as follows: This tab has two tools. One is named the Grab and the other is named Pick. The tools are used to create and edit crosshairs and to navigate with the mouse or a tablet. AutoCAD's Grab tool is used to select specific objects in the drawing, including lines, circles, squares, rectangles, and polygons. The Pick tool allows you to select a particular point in the drawing, regardless of the selected objects. The point must be on a previously selected object or on the previous selection. You use the PICK command from the Home tab to select an object. It is a shortcut to the Select tool on the Home tab. The Pick tool can be used to create a new point in the drawing. You can also use the Pick tool to move

I am setting up a laptop for my friend who doesn't like security and his password is somewhere under the mattress. I could use the LiveDisk to access the machine remotely (assuming I can get access to it), but I am worried about security. I don't want him to see me go in or anything, but it's not like he would even know that his laptop is being accessed over a remote connection. He wouldn't be able to do anything that would leave any kind of trace, which should be good enough for his use case. I guess I could install some sort of keylogger, but I would have to reboot before I could access the machine to remove the keylogger before I could access it. Is there anything else I need to do to make sure this laptop is secure? Is this a bad idea, or should I just get over it? A: No problem accessing a computer remotely, the first thing to do is to enable remote desktop. It will allow you to connect to the computer when it is on and allow you to do tasks remotely using the desktop environment. If you have administrative privileges on the remote computer, you can also install software remotely. In this case, you would install a keylogger without asking your friend. If you don't have the permissions to do anything else (and you do not want to steal his information), then you can use remote control software to do everything remotely. I use TeamViewer and I find it very useful for a lot of things, not only remote access. With that software, the only thing you need to do is to install it on the remote computer and connect to it with the credentials your friend uses to access his computer. It will connect as it is configured on the remote computer and your friend will be none
